# Preface

---

This report describes Alaska's projected future population based on historical population data and rates of fertility, mortality, and migration. These projections provide planners and policy makers with possible outcomes of a series of demographic events.

It is important to note that Alaska is susceptible to many unpredictable events, and that no demographer or economist is able to foresee the future. Our projections are based on past and hypothetical future population trends.

Special acknowledgment goes to the Alaska Department of Health and Social Services for providing essential information for these projections.

We welcome comments or suggestions on the content or format of this publication. Many of the most requested statistics in this document are also available on the Research and Analysis website at [laborstats.alaska.gov](http://laborstats.alaska.gov). Send requests for demographic projections information to David Howell, Research and Analysis Section, Alaska Department of Labor and Workforce Development, P.O. Box 115501, Juneau, AK 99811-5501. Telephone: (907) 465-6029; FAX: (907) 465-4506; e-mail: [david.howell@alaska.gov](mailto:david.howell@alaska.gov).

# Introduction and Overview

---

These population projections cover 2019 through 2045 for Alaska by age and sex as well as for Alaska Native and region, borough, and census area populations.

Population projections are distinct from population estimates in that estimates use current and historical data to make statements about the present and past population while projections use expected or extrapolated data to make statements about future populations. Though projections are uncertain, they're based on reasoned assumptions and are an important tool for planners and policy makers.

To create this set of projections, we used a cohort-component technique, separating the population of males and females into age groups and aging them forward in time. We then added projected births and in-migrants and subtracted projected deaths and out-migrants. See Appendix A for technical details.

These projections are for residents as defined by the U.S. Census Bureau. The Census Bureau uses the concept of "usual residence" (self-reported) to determine where people are counted.

## Statewide Projections

Alaska's population is projected to grow from 731,007 in 2019 to 813,822 in 2045. As the population ages in the coming years, annual natural growth is expected to slow. We expect Alaska's population aged 65 or older to grow most (42 percent) over the projection period followed by the population aged 20 to 64 (7 percent). Due to recent declines in birth rates, the population aged 0 to 19 is projected to grow least (6 percent).

Because growth is so uncertain, we created three possible scenarios for the statewide projections. We divided the population into single-year age groups by sex and projected forward one year at a time. We repeated this process three times, keeping the mortality and fertility projections the same but varying the net migration rate. The middle projection for Alaska uses an annual net migration rate of

-0.7 percent for the first year and -0.1 percent thereafter, the high scenario uses a net migration rate of 1 percent, and the low scenario uses a net migration rate of -1 percent.

## Alaska Native Projections

The Alaska Native population, including Alaska Natives who report more than one race, is expected to grow 15 percent over the period, from 148,330 in 2019 to 170,783 in 2045. Like the state as a whole, the Alaska Native population's growth is expected to slow as the population ages.

To create projections for the Alaska Native population, we divided the population into five-year age groups by sex, then projected forward in five-year intervals. We created projections of mortality, fertility, and migration rates based on recent time series data.

## Region, Borough, and Census Area Projections

Alaska's regions, boroughs, and census areas have grown and are projected to continue to grow at different rates, with the fastest population growth in the Anchorage/Mat-Su Region.

For projections by borough and census area, we broke the populations into five-year age groups by sex and projected in five-year intervals using the cohort-component method. We created projections of mortality, fertility, and migration rates for each borough and census area based on recent time series data.

We projected each borough and census area population separately, with the sum of all borough and census area projections closely matching the statewide middle scenario projection at each step. We eliminated any discrepancies between the sum of the borough/census area projections and the statewide middle scenario projection with proportional fitting (described in Appendix A).

## Section 1

# Statewide Population Projections

As of July 1, 2019, Alaska's estimated population was 731,007.

Population change has four distinct processes, or components: fertility, mortality, in-migration, and out-migration. We used historical data on each of these components to create these projections.

This section begins with a brief description of Alaska's recent population background, then describes Alaska's mortality, fertility, and migration levels and their impact on the projections. Finally, it presents the results and interpretation of the statewide projections.

## Background

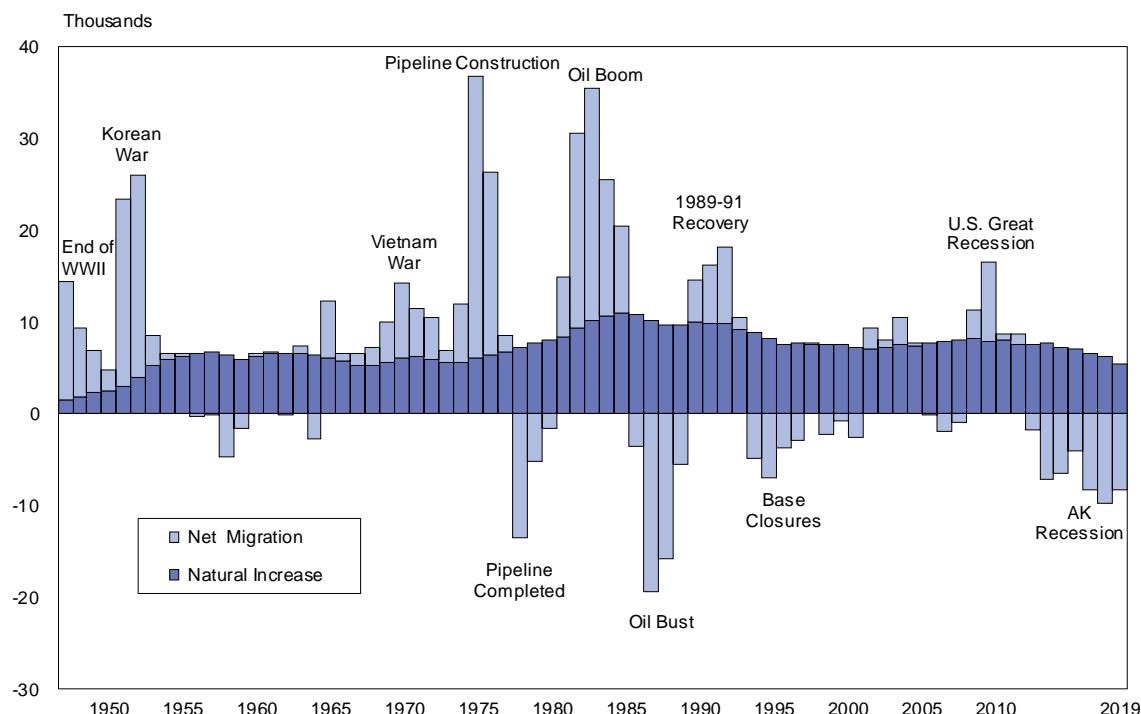

Since statehood in 1959, when the population was roughly 224,000, Alaska has grown at varying rates. As Figure 1.1 shows, both natural increase (the difference between births and deaths) and net migration (the difference between in-migration and out-migration) have played important roles.

Since statehood, natural increase has provided Alaska with steady growth. In- and out-migration have been far more uncertain components of this population change, as the numbers of people moving into and out of the state have varied greatly from year to year.

The discovery of oil in Prudhoe Bay in 1968 and the subsequent construction of the Trans-Alaska Oil Pipeline in the 1970s had a massive effect on Alaska's population, both immediately and in the decades that followed. Tens of thousands of workers and their dependents poured into the state for the construction of the pipeline and many left at its completion. In the years that followed, a huge number of migrants flowed into Alaska with new oil revenues and increased oil prices, but a large number left when oil prices fell dramatically in 1985.

These projections don't include events on the scale of the Trans-Alaska Oil Pipeline. They do happen, however, and the oil discovery at Prudhoe Bay demonstrates that major economic events are always possible.

## Cohort-Component Method

We created this set of population projections through a “cohort-component” technique. Under this approach, we separated the population into specified age groups by sex and aged them forward in time, adding projected births and in-migrants at each step while subtracting deaths and out-migrants.

Two of the distinct benefits of this approach are its careful disaggregation of the components of population change and its production of projections by age and sex.

To estimate the effects of mortality and fertility on population change, we applied distinct rates of mortality and fertility to each age-sex group as we aged them forward. To estimate the impact of migration, we applied the number of people resulting from annual rates of in- and out-migration to age-by-sex profiles. We then added the calculated number of in-migrants to each respective age-sex group and subtracted the number of out-migrants from each group.<sup>1</sup>

<sup>1</sup>Further description of the cohort-component method is provided by Preston, Heuveline, and Guillot (2001).

## Migration and Alternative Scenarios

Two values project migration for Alaska: the annual rate of in-migration (the number of in-migrants divided by Alaska’s mid-year population), and the annual rate of out-migration (the number of out-migrants divided by the mid-year population). The difference between the in- and out-migration values is the net migration ratio, which is equal to the total number of in-migrants minus the total number of out-migrants, divided by the mid-year population.

Because uncertainty about the future is a major factor in all population projections and migration is the most uncertain component of population change, these projections include three scenarios with varying net migration ratios.

Figure 1.3 shows the dramatic swings of Alaska’s net migration rate in the past and the three net migration rate paths we used for the different projection scenarios: -0.7 percent for the first year then -0.1 percent afterward for the middle scenario, 1 percent for the high scenario, and -1 percent for the low scenario.

For the last several years, Alaska’s net migration has been negative, but because the future isn’t clear, countless scenarios are possible. Future employment will play a large role in migration, but changes in unemployment and labor force participation rates can play equally important parts. For the middle scenario, we extended the significant net migration losses of recent years for one year, based on ongoing statewide employment losses, and use the 1989 to 2019 net migration annual average of -0.1 percent thereafter.

Although the differences between the scenarios we use may appear slight, they result in large differences in the projected population once each scenario is applied to our 28-year future projection period. While a number of states over recent decades have had net migration consistently around 1 percent or more of total population — including Nevada, Arizona, Washington, and Colorado — no state’s net migration has remained around -1 percent per year. Comparing 1980 to 2010 total population shows West Virginia was the only state with a loss — from 1.95 million to 1.85 million residents.

## Mortality

Life expectancy at birth (or period life expectancy at birth) for a given year is the average number of years a person would live if he or she lived an entire life according to the respective year’s age-specific mortality rates. Although life expectancy varies greatly from group to group within Alaska, Alaska’s total life expectancy has been fairly close to that of the United States as a whole.

As Table 1.2 shows, life expectancies in Alaska and the U.S. have been similar, with both steadily increasing over recent decades. Given the stability of mortality rates in Alaska, we applied a single path for change based on the U.S. Social Security Administration's projected future change in U.S. mortality.

The Social Security Administration projects that between 2010 and 2050, life expectancy will increase by 4.0 years for American men and 3.2 years for American women. Following fitted parameters based on this change, we expect life expectancy in Alaska to increase by 3.0 years for men and 2.4 years for women between 2010 and 2050.<sup>3</sup>

## Fertility

The total fertility rate, or TFR, for a specific year is the number of children a woman would have if she followed that year's age-specific fertility rates throughout her lifetime. A TFR of approximately 2.1 (children per woman) is necessary for long-term replacement-level natural increase.

Figure 1.2 displays historical estimates for Alaska's TFR. Alaska's TFR has declined some in recent years and was at replacement level, 2.1, between 2016 and 2018. Alaska's TFR remains higher than the U.S. average (1.7) and still provides steady growth from natural increase.

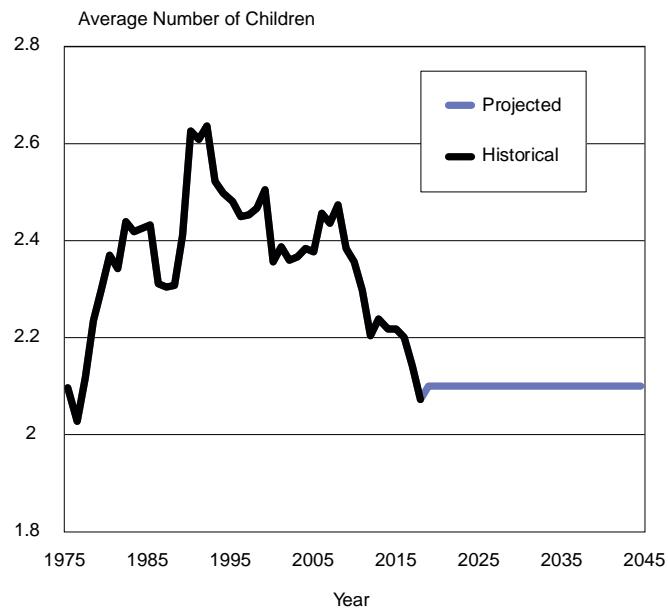

## Components of Change

Table 1.3 provides projections of future levels of births, deaths, and net migration. The middle values are the expected births, deaths, and net migration with a net migration ratio of -0.7 percent for 2019 to 2020 and then -0.1 percent for the following years. The high and low projections of births, deaths, and net migration are the projected values if the net migration ratio for Alaska were fixed at 1 percent and -1 percent, respectively.

The middle and high projection scenarios show an increase in the number of births while the low scenario projects a slight decline in births. As the projection extends toward 2045, the difference in the projected number of births becomes much larger due to the accumulating difference in numbers of net migrants.

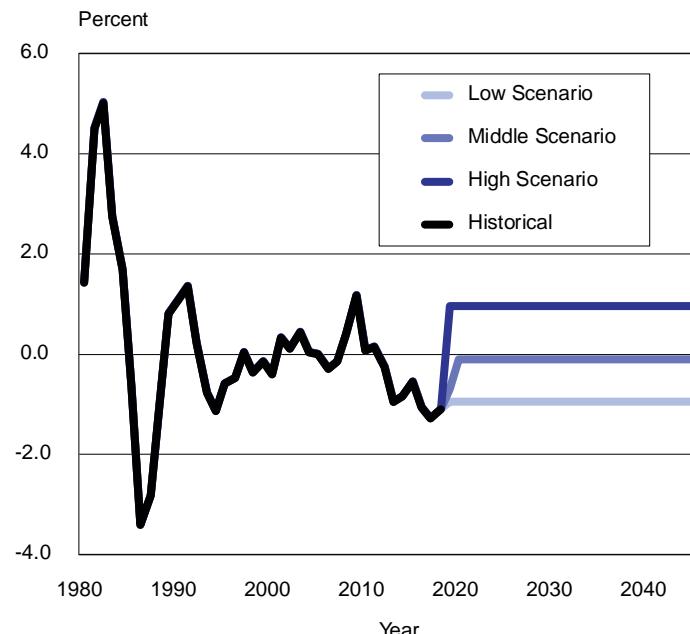

We expect the number of deaths in Alaska to

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

increase greatly over the projection period. With the aging of the “baby boom” generation (those born in the high fertility period from 1946 to 1964), Alaska — like all states — will have a much larger elderly population than in the past, which will raise the annual number of deaths. Increasing differences in expected numbers of deaths are due to the varying levels of migration for each of the projection scenarios.

## Alaska’s Population Growth

Table 1.4 displays projections of the levels of population growth in Alaska from 2019 to 2045 and the outcome of different growth levels on the projected statewide population.

With the expected increase in deaths relative to births, it’s likely the growth rate will decline over the projection period. The middle and high projection scenarios show

overall increases for population while the low scenario projects a substantial loss in population.

Figure 1.4 displays the different paths projected for Alaska’s total population through 2045. With time, the different scenarios for Alaska’s net migration cause differences between projected populations to increase greatly.

The middle projection produces a population for 2025 of 753,360, growing to 787,706 in 2035 and reaching 813,822 by 2045. The low scenario has population dropping to 631,738 by 2045, and the high has it increasing to 1,110,932 people.

## Future Population by Age and Sex

Tables 1.5 to 1.7 break down projections for Alaska’s population by age and sex for each of the three scenarios. The median age of Alaska’s population is projected to increase

at a steady pace, rising from 35.5 in 2019 to 37.3 in 2045. The ratio of males per 100 females is expected to decline from 106.1 to 103.6.

Figures 1.8 through 1.11 show population pyramids for the middle scenario for 2019, 2025, 2035, and 2045.

## Selected Age Groups

Figures 1.4 through 1.7 display the projected population for specified age groups. Alaska's population ages 0 to 19 is projected to increase 6 percent, from 201,925 to 214,949 between 2019 and 2045.

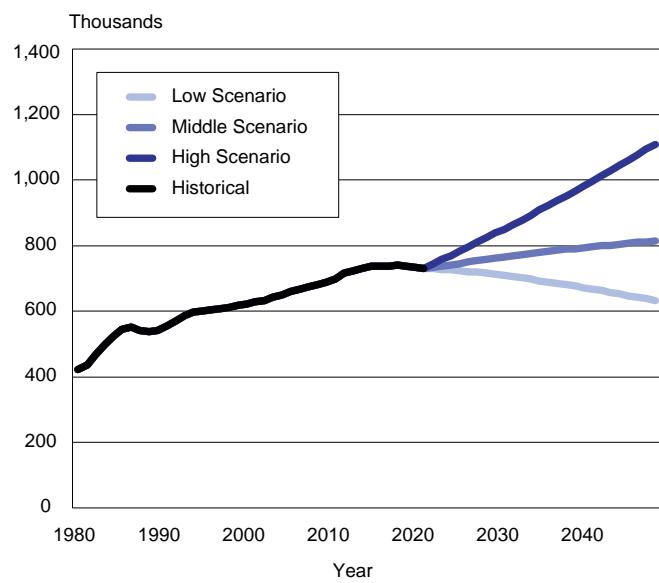

Alaska's population aged 20 to 64 is an approximate representation of the working-age population. Alaska had 437,804 working-age people in 2019 and we expect it to rise to 468,991 by 2045 (7 percent). As baby boomers move

into retirement years, the echo boomers will continue to age through their working years, yielding little change in the working-age population in the first 15 years of the projection period. (See Figure 1.6.)

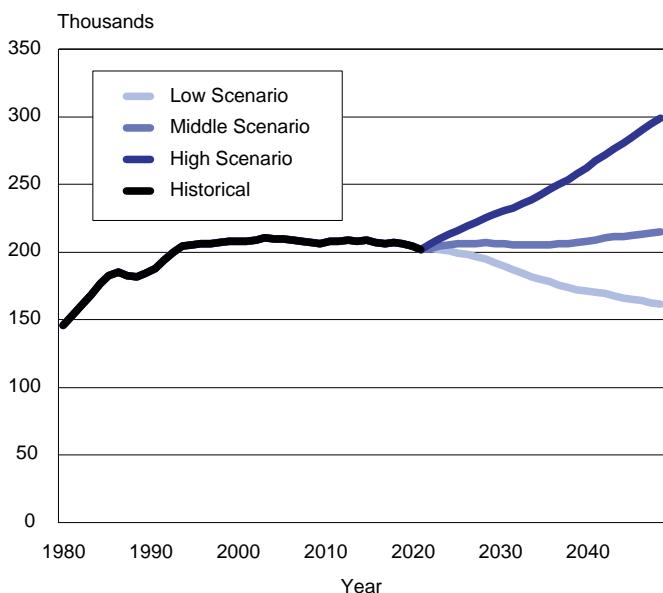

The population aged 65+ is largely made up of retirees. While there is a great deal of uncertainty about future population for younger ages, which are substantially affected by shifts in fertility and migration rates, people at higher ages are less affected by these. Alaska's large cohort of aging baby boomers means strong growth in Alaska's senior population is very likely.

Alaska's current population aged 65 or older is 91,278 and is projected to increase 42 percent by 2045, reaching 129,882 people. Toward the end of the projection period, all baby boomers will be well into this age group.

## Section 2

# Alaska Native Population Projections

---

This section presents projections for the Alaska Native population by age and sex from 2019 through 2045. We created these projections based on our estimate for the number of Alaska Natives who are Native alone or in combination with one or more other races.<sup>1</sup> While all Native Americans residing in Alaska are included in the Native projections, this group is almost entirely Alaska Native and will be referred to here as Alaska Native.

The Alaska Native population represents approximately 20 percent of the state's population. With high fertility and relatively low rates of migration, population growth is steady for Alaska Natives. Be aware, though, that we based these projections on recent rates, which will vary somewhat over time.

## Methodology

We divided the Alaska Native population into five-year age groups according to sex, then projected forward in five-year increments from the 2015 Alaska Native race alone or in combination population estimates, using the cohort-component method. We then added projected births, subtracted deaths, and subtracted net migration from the appropriate age-by-sex group.

---

<sup>1</sup>Appendix A further describes the Alaska Native estimates, the projection methods, and the methods for estimating age-by-sex-specific mortality, fertility, and migration.

## Migration

Alaska Natives' rates of migration into and out of Alaska are low compared to the state as a whole. After analyzing data from the 2000-2019 race alone or in combination estimates, along with birth and death data, we set the annual net migration rate at -0.5 percent of the population per year. The projections continue this level of net migration through 2045.

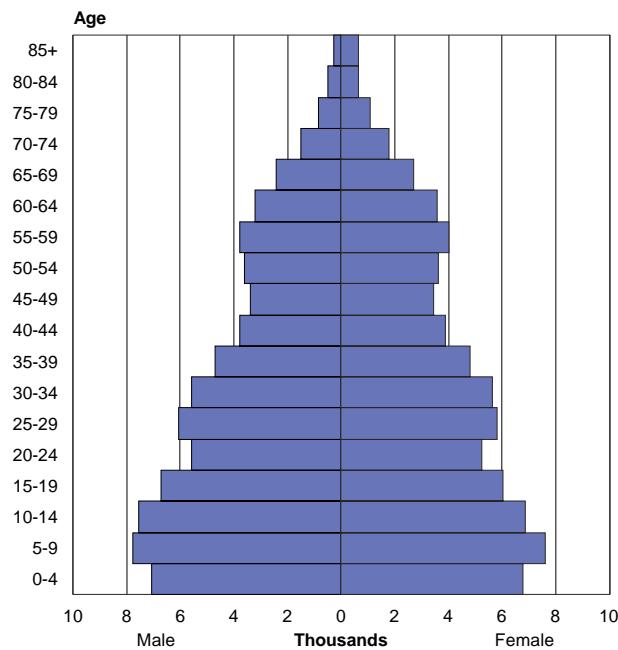

## Overall Population Change

The Alaska Native population is projected to grow steadily through 2045, from 148,330 in 2019 to 170,783 in 2045. Further, we project Alaska Natives will slightly increase their share of Alaska's total population, from 20 percent in 2019 to 21 percent in 2045. Annual births and deaths for Alaska Natives are both projected to increase over the period; however, we expect births to be consistently higher than deaths.

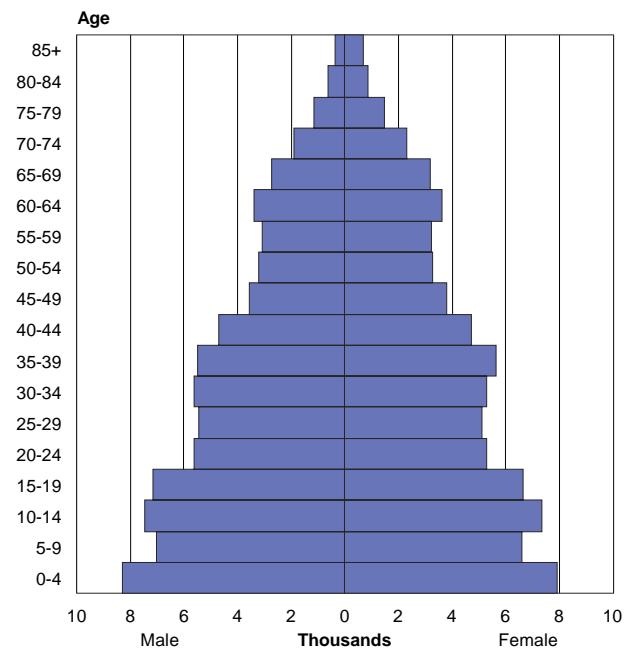

## Aging

Aging will play an important role in population change for Alaska Natives over the projection period, as their median age is projected to rise from 28.0 to 29.3. The Alaska Native population aged 65+ is projected to increase by 44 percent between 2019 and 2045, rising from 12,409 to 17,821.

# Section 3

## Region, Borough, and Census Area Projections

This section presents population projections for Alaska's economic regions, boroughs, and census areas by age and sex. Population projections for smaller areas have a much higher degree of uncertainty. Migration between boroughs, specific policy and economic factors, and unique historical events will all play important roles in determining actual population change.

Borough and census area projections are based on recent trends. Be aware that countless unforeseen factors could sway many of the populations dramatically. The projected populations for each economic region, borough, and census area are presented by age and sex in five-year age groups from 2019 to 2045.

### Methodology

For each borough and census area projection, we divided the population into age-by-sex groups and projected them forward in five-year increments from the 2015 population estimate using the cohort-component method.<sup>1</sup> We then added projected births and in-migrants and subtracted deaths and out-migrants from the appropriate age-by-sex group at each step. The projections for Alaska's economic regions are the sums of the boroughs and census areas they cover.

We projected each borough/census area population independently, using recent age-specific fertility rates to project births, recent and projected age-by-sex-specific mortality rates to project deaths, and recent annual migration data (adjusted for five-year intervals) and age-by-sex migration profiles to project migration.

We held constant the group quarters population (population not living in households) by age, sex, and size for Aleutians East Borough, Aleutians West Census Area, and North Slope Borough.<sup>2</sup>

The sum of the borough and census area projections at each step matched closely with the middle statewide projection. Proportional fitting eliminated any discrepancies between the middle state projection and the sum of the borough and census area projections.

<sup>1</sup>Further description of the cohort-component method is provided by Preston, Heuveline, and Guillot (2001).

<sup>2</sup>Appendix A further describes the methods for estimating age-specific mortality, fertility, and migration rates.

### Births

Alaska's crude birth rate (the number of births per 1,000 people) for 2019-2020 is projected to be 14.2. With the overall aging of Alaska's population, this figure is projected to decline to approximately 13.5 by 2045.

Birth rates vary greatly across boroughs and census areas. The highest crude birth rates in 2019 were in Kusilvak Census Area (29.0), Bethel Census Area (23.1), and Northwest Arctic Borough (22.3).

The lowest birth rates for 2019 were found along the Aleutian chain and primarily in Southeast Alaska. In the Aleutians East Borough and Aleutians West Census Area, where much of the population lives in group quarters for fishing and fish processing, the crude birth rates were 2.4 and 6.1, respectively. Other areas with low birth rates included Petersburg Borough (5.9), the City and Borough of Sitka (7.9), and Haines Borough (8.7).

The rank-order of crude birth rates for boroughs and census areas will probably not change much over the projection period. While birth rates will change as the population composition shifts, places with relatively high birth rates will likely remain high and those with low rates will remain relatively low.

### Deaths

Alaska's crude death rate (the number of deaths per 1,000 people) in 2019 was 6.3. The greatest contributing factor to this figure was the ratio of senior citizens to the overall population.

Like crude birth rates, crude death rates vary among areas. The highest 2019 rates were in the City and Borough of Yakutat (14.8), Yukon-Koyukuk Census Area (11.0), and Prince of Wales-Hyder Census Area (10.7). Those with the lowest crude deaths rates included Aleutians West Census Area (2.2), Aleutians East Borough (2.7), and Municipality of Skagway Borough (3.7).

As Alaska's population ages over the projection period, crude death rates will likely increase in all boroughs and census areas.

### Migration

As with statewide migration, migration into and out of Alaska's boroughs and census areas represents a highly un-

stable component of population change. We used two values to project migration for Alaska's boroughs and census areas: the annual net migration ratio (net migration divided by the borough or census area's mid-year population) and the annual out-migration rate (the number of out-migrants divided by the borough or census area's mid-year population). We estimated out-migration and net migration levels for each borough/census area based on 2009 to 2019 data to project migration through 2045.

We distributed the migrants proportionally using age-by-sex migration profiles to estimate the number of migrants for each specific age-by-sex group. The migration levels applied for the projection period reflect those from recent history.

The Matanuska-Susitna Borough is the only area we project to have strong positive net migration through the projection period.

Rural boroughs and census areas with high fertility rates, such as Kusilvak Census Area, Nome Census Area, and Northwest Arctic Borough, are projected to lose the most population through net migration but continue to grow overall through natural increase.

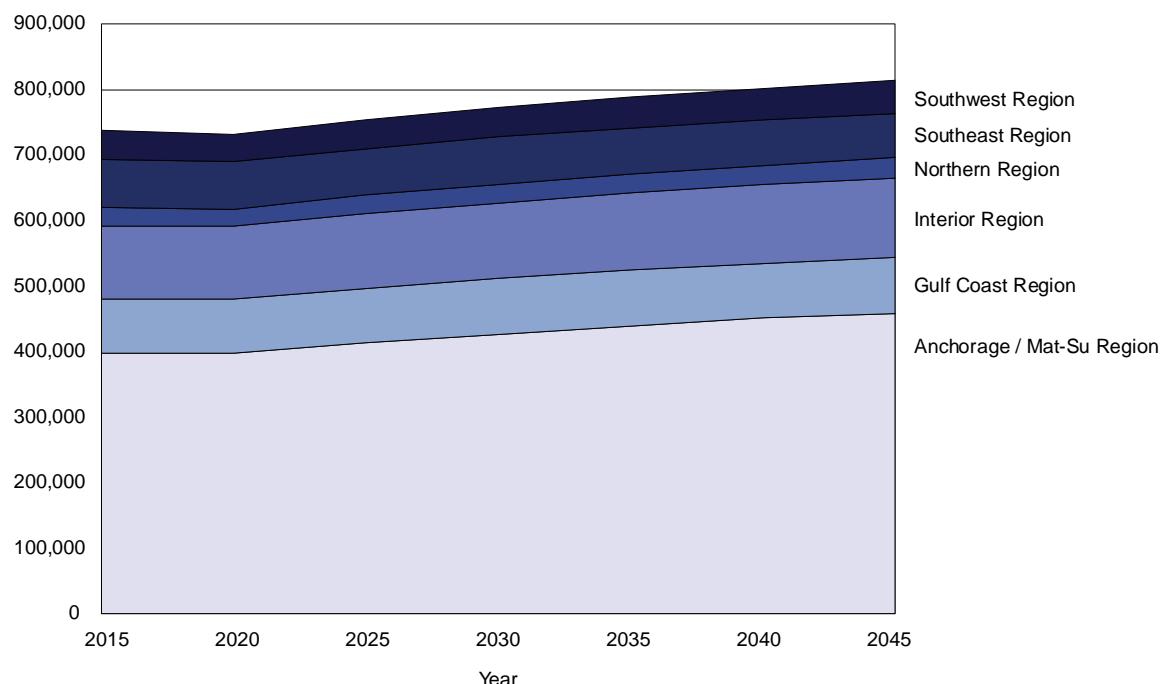

## Overall Results

As shown in Figure 3.1, we project the strongest growth for the Anchorage/Mat-Su Region, with the Matanuska-Susitna Borough's population projected to increase over 40 percent by 2045. The continuation of recent population trends for Alaska's economic regions include some degree of growth over the period for each of Alaska's economic regions.

We do not expect the population rank-ordering of the regions to change over the projection period. Through high fertility rates, the Northern and Southwest regions are projected to continue growing despite somewhat strong net losses from migration.

The boroughs/census areas with the highest levels of projected average annual growth over the period include: Mat-Su Borough (1.7 percent), Kusilvak Census Area (1.4 percent), and Municipality of Skagway (1.0 percent). The boroughs/census areas projected to have the highest levels of average annual population loss over the period are Bristol Bay Borough (-0.7 percent), the City and Borough of Yakutat (-0.6 percent), Yukon-Koyukuk Census Area (-0.5 percent), and Hoonah-Angoon Census Area (-0.5 percent).

# Appendix A

## Technical Notes

---

This technical appendix explains the methods used to produce the 2019 to 2045 Alaska population projections. It first presents methods we used to estimate and project statewide mortality, fertility, and migration rates, then describes how we applied those estimates with a cohort-component model.

Next, this appendix discusses how we projected each borough and census area's mortality, fertility, and migration rates and applied them with a cohort-component model.

Finally, it explains the race "alone or in combination" estimates and the methods for projecting Alaska Native births, deaths, migration, and population. All computations used the R statistical package, SPSS, and Microsoft Excel.

### Statewide Mortality

We used the Brass relational logit model for mortality (Preston, Heuveline, and Guillot, 2001) to project mortality rates. Projected mortality rates are based on a linear interpolation of Brass coefficients calculated from Social Security life tables for the United States for 2017 and 2050 (Bell and Miller, 2005), by sex. We then applied the interpolated coefficients to a 2016 to 2018 Alaska life table, created using Alaska vital statistics data, producing age-specific mortality rates for 2019 through 2045 for males and females.

### Statewide Fertility

To project fertility, we used 2016 to 2018 Alaska vital statistics data to create a proportional age-specific fertility profile. We then multiplied the profile by a total fertility rate (sum of age-specific fertility rates) of 2.1 and held it constant across the projection period.

### Statewide Migration

Two values project migration for Alaska: the annual rate of in-migration (the number of in-migrants divided by Alaska's mid-year population), and the annual rate of out-migration (the number of out-migrants divided by the mid-year population).

The difference between the in- and out-migration values is the net migration rate, which is the total number of in-migrants minus the total number of out-migrants, divided by the mid-year population.

To make the different net migration scenarios, we adjust-

ed both the in-migration rate and the out-migration rate. For the middle scenario, we used an annual rate of -0.7 percent for the first year, based on the last few years of migration losses, and -0.1 percent — in line with Alaska's long-term, 1990 to 2019 level of net migration — thereafter. We set the in-migration rate to 5.3 percent and the out-migration rate to 6.0 percent for the first year, and set the in-migration rate to 5.9 percent and the out-migration rate to 6.0 percent for subsequent years.

For the high scenario, which has a 1 percent net migration rate, we set the in-migration rate to 6 percent and the out-migration rate to 5 percent. For the low scenario, which has a -1 percent net migration rate, we set the in-migration rate to 5 percent and the out-migration rate to 6 percent.

We then assigned the overall numbers of in- and out-migrants to the proper age-by-sex categories based on share profiles for in- and out-migration. We estimated migration share profiles by subtracting births and deaths from age-specific Alaska Permanent Fund Dividend applicant nonmatches, or people who were absent from one year of two consecutive annual Permanent Fund Dividend applicant files.

### Statewide Projection Model

Once we calculated the necessary components, we applied them with a cohort-component projection model (Preston, Heuveline, and Guillot, 2001). For this model, we used Leslie Matrices to project natural increase — the effects of births and deaths on a population — while subtracting projected out-migrants and adding in-migrants at each step. We ran this model three times with the different migration scenarios to produce the middle, high, and low projections.

### Borough and Census Area Mortality

Given the very small populations of Alaska boroughs and census areas, it wasn't practical to create age-by-sex specific mortality rates at the sub-state level. Rather than apply the statewide levels of mortality to each borough and census area, we decided to account for the distinct racial composition of each area and adjust the levels of mortality accordingly. We linearly interpolated levels of mortality between statewide Alaska Native (alone or in combination with one or more other races) and non-Native life tables based on the total proportion of Alaska Natives in each

borough and census area.

The next step was to apply the Brass projection coefficients that were calculated for statewide mortality to the interpolated life tables. Applying the Brass coefficients yielded age-specific rates of mortality for 2015 through 2045, based on the U.S. Social Security Administration's projected change in U.S. mortality.

## Borough and Census Area Fertility

We calculated age-specific fertility rates for each borough and census area using data from 2014 to 2018 with adjustments for group quarters populations (population not living in households), and held those rates constant through the projection period.

## Borough and Census Area Migration

We estimated migration for each borough and census area using the net migration ratio and the out-migration rate of each area, based on 2009 to 2019 population estimates and Alaska Permanent Fund data, with adjustments for births, deaths, and group quarters populations. Adding the net migration rate to the out-migration rate produced the in-migration rate (number of in-migrants divided by the mid-year population). We distributed migrants according to age-by-sex migration share profiles, previously estimated from 2015 to 2019 Permanent Fund Dividend data.

The net migration rates of boroughs and census areas are set to gradually converge toward the 0.1 net migration ratio of the middle state projection — sub-state net migration rates are halved over the projection horizon. This adjustment allows boroughs and census areas with positive net migration to continue gaining a reasonable number of in-migrants while keeping boroughs/census areas with high net migration losses from losing an unreasonable number of people to out-migration.

We further adjusted net migration rates for Bristol Bay Borough, Hoonah-Angoon Census Area, the City and Borough of Sitka, and the City and Borough of Yakutat by halving their negative rates, because results based strictly on historical data were unreasonably low. We adjusted the net migration rates of the Municipality of Anchorage and Fairbanks North Star Borough by using a longer time series of net migration rates: 2000 to 2019.

## Borough and Census Area Projections

For borough and census area projections, we used the cohort-component method, like the state projection but with five-year steps starting with 2015 instead of single-

year because of the smaller populations. We ran the model separately for each borough and census area, putting in each area's unique components of change.

To measure the closeness of the statewide and sum-of-borough population projections by age and sex, we calculated the "mean absolute percent error" (Smith, Tayman, and Swanson, 2001) across the ages and sexes and found less than 10 percent average errors among the age-by-sex groups for each projection step. We then proportionally adjusted the sub-state age-by-sex projections to match the middle state age-by-sex projection (Smith, Tayman, and Swanson, 2001).

## Alaska Native Alone or In Combination

Beginning in 2000, the U.S. Census Bureau reformatted its race question, allowing people to select more than one race category. In previous population projections reports, we continued to provide Alaska Native and American Indian "bridged" data, which matched the pre-2000 categories, but in recent releases we provided projections for Alaska Native and American Indian alone or in combination with one or more other races.

## Alaska Native Population Projections

To estimate age-by-sex-specific mortality rates for Alaska Natives, we used Alaska Native mortality data from Alaska vital statistics for 2016 to 2018. We then applied the Brass coefficients from the U.S. Social Security Administration to project age-by-sex mortality through 2045. To project fertility, we used 2016 to 2018 Alaska vital statistics data to create a proportional age-specific fertility profile. We then multiplied the profile by a total fertility rate (sum of age-specific fertility rates) of 3.0 and held it constant across the projection period.

To estimate migration for Alaska Natives, we used the cohort-component method with the mortality and fertility age-by-sex profiles but no migration to project the 2010 estimated population to 2015. We compared the projected values with separate 2015 Alaska Native population estimates to find cohort change differences, estimating the amount of migration occurring within each age-by-sex interval. We further adjusted the overall level of migration based on Alaska Native population estimates for 2000–2018.

Then, as we did with the boroughs and census areas, we used the cohort-component method to project the Alaska Native population by age and sex in five-year steps from 2015 to 2045.
